日本語要約

A decade's perspective on DNA sequencing technology

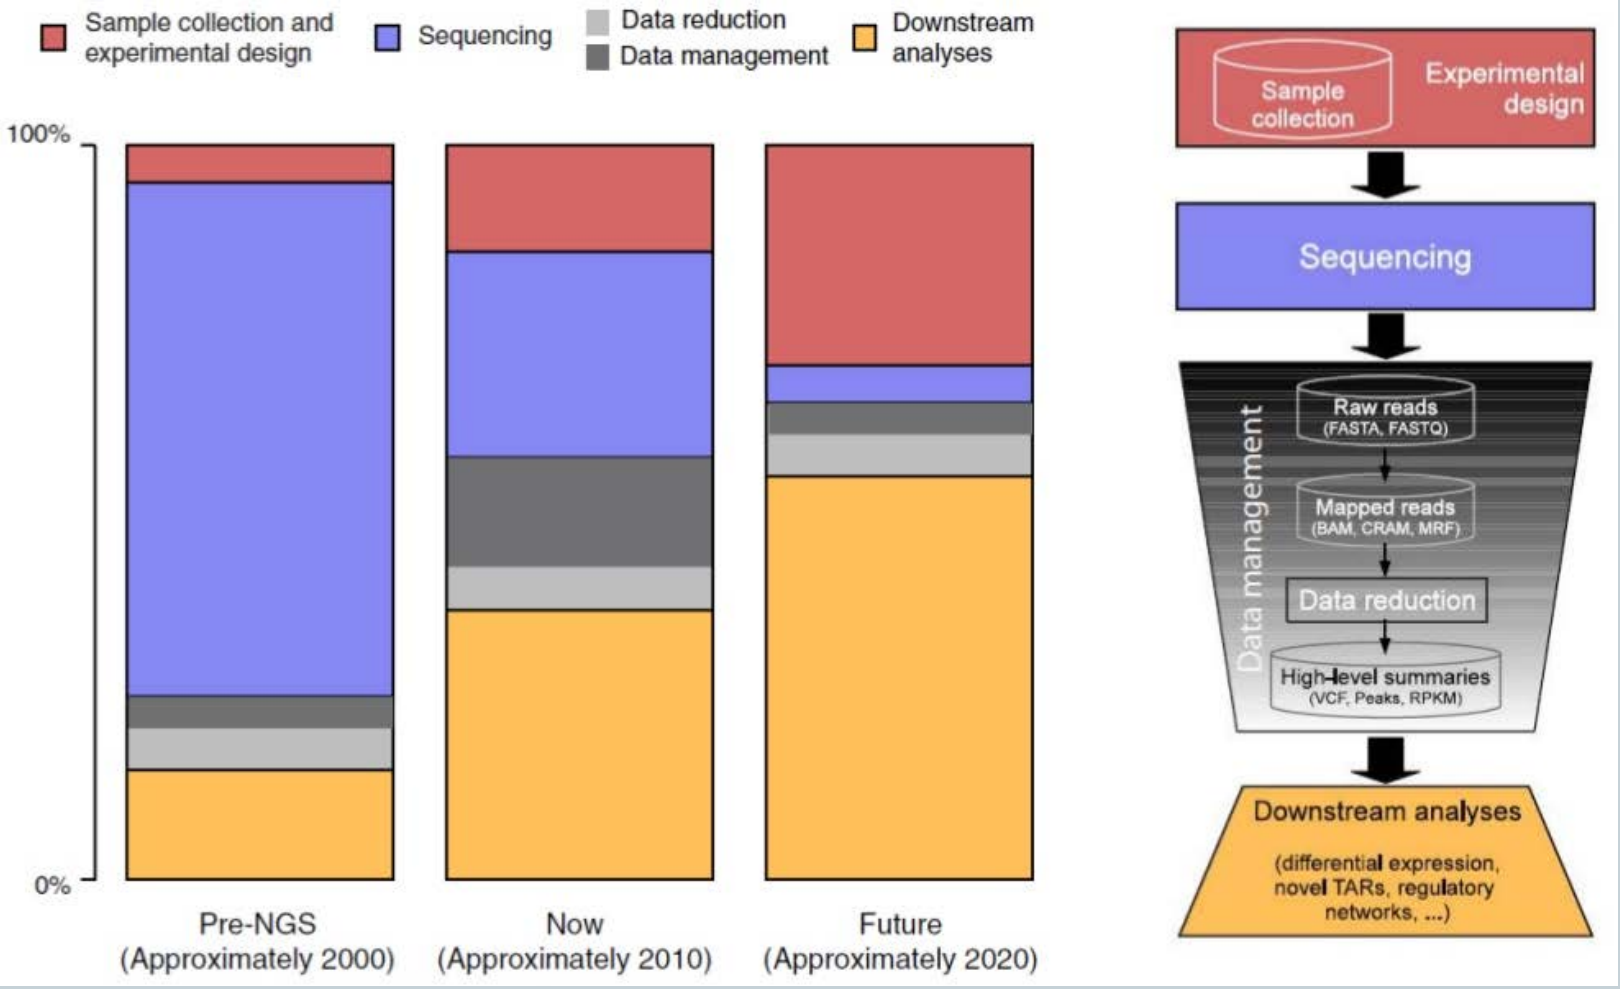
Elaine R. Mardis

Nature **470**, 198–203 (10 February 2011) | doi:10.1038/nature09796

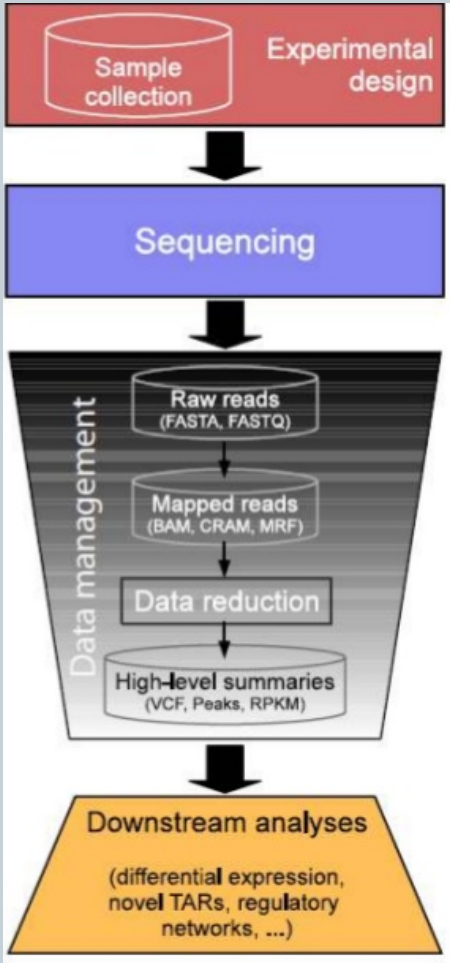
Published online 09 February 2011

Changes and Timing past decade

Overview of costs (past, present and near future)



Steps in sequencing experiments



Data analysis

Raw machine reads… What's next?

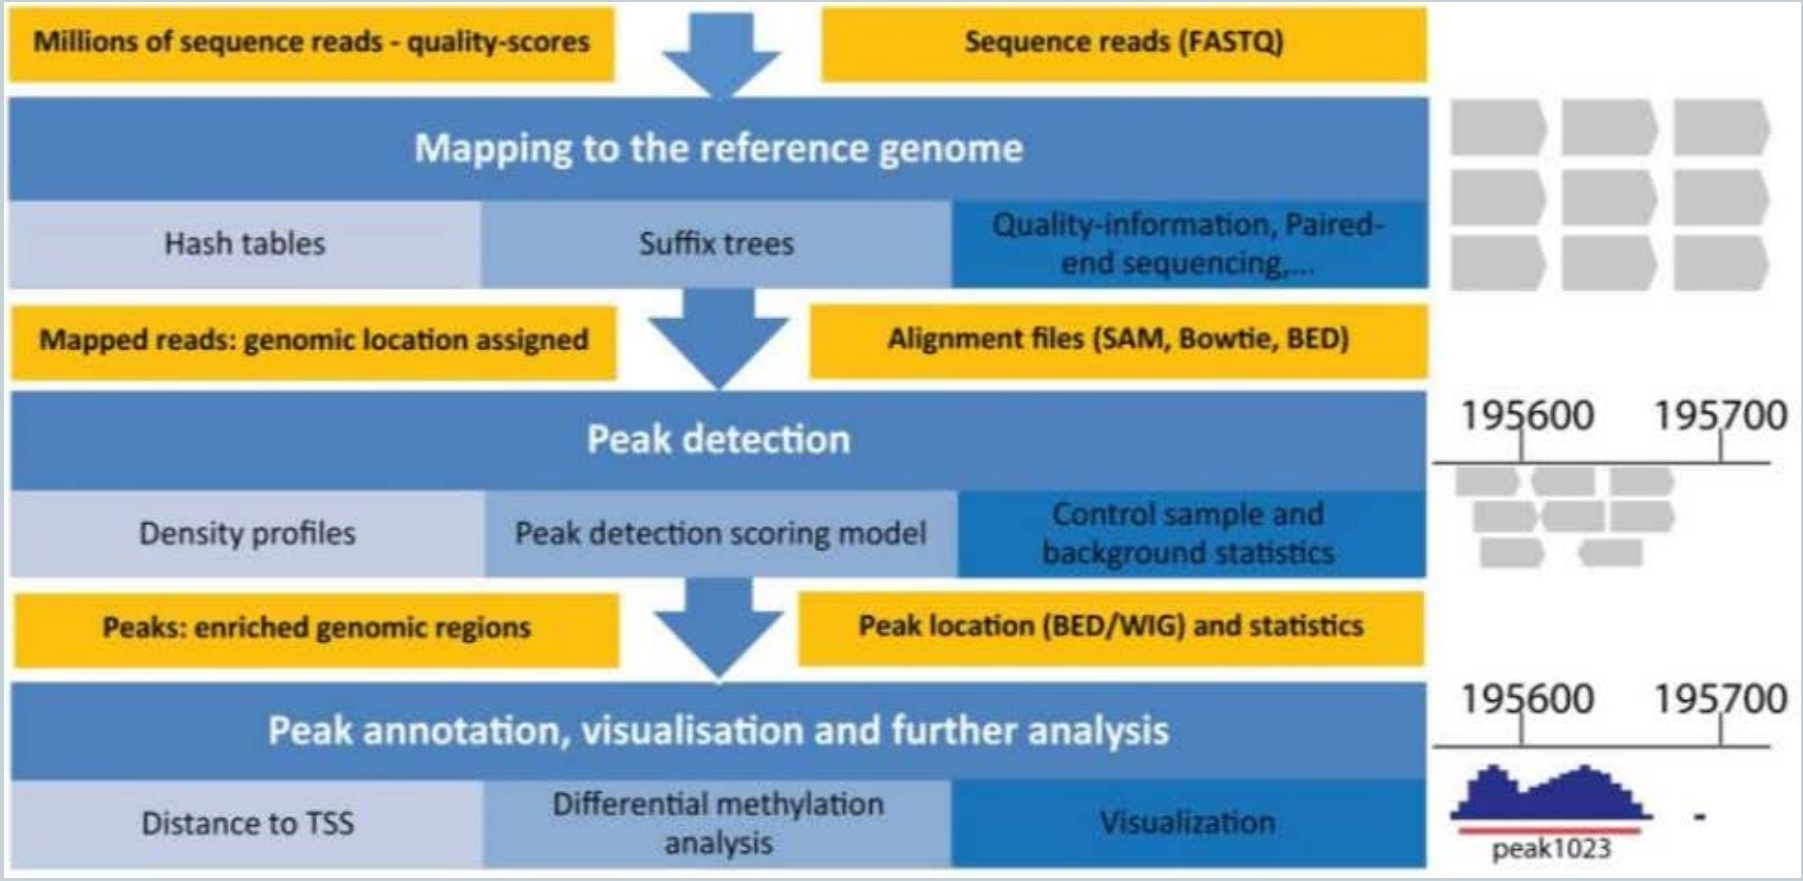
Preprocessing (machine/technology)
- adaptors, indexes, conversions,…
- machine/technology dependent

Reads with associated qualities (universal)
- FASTQ
- QC check

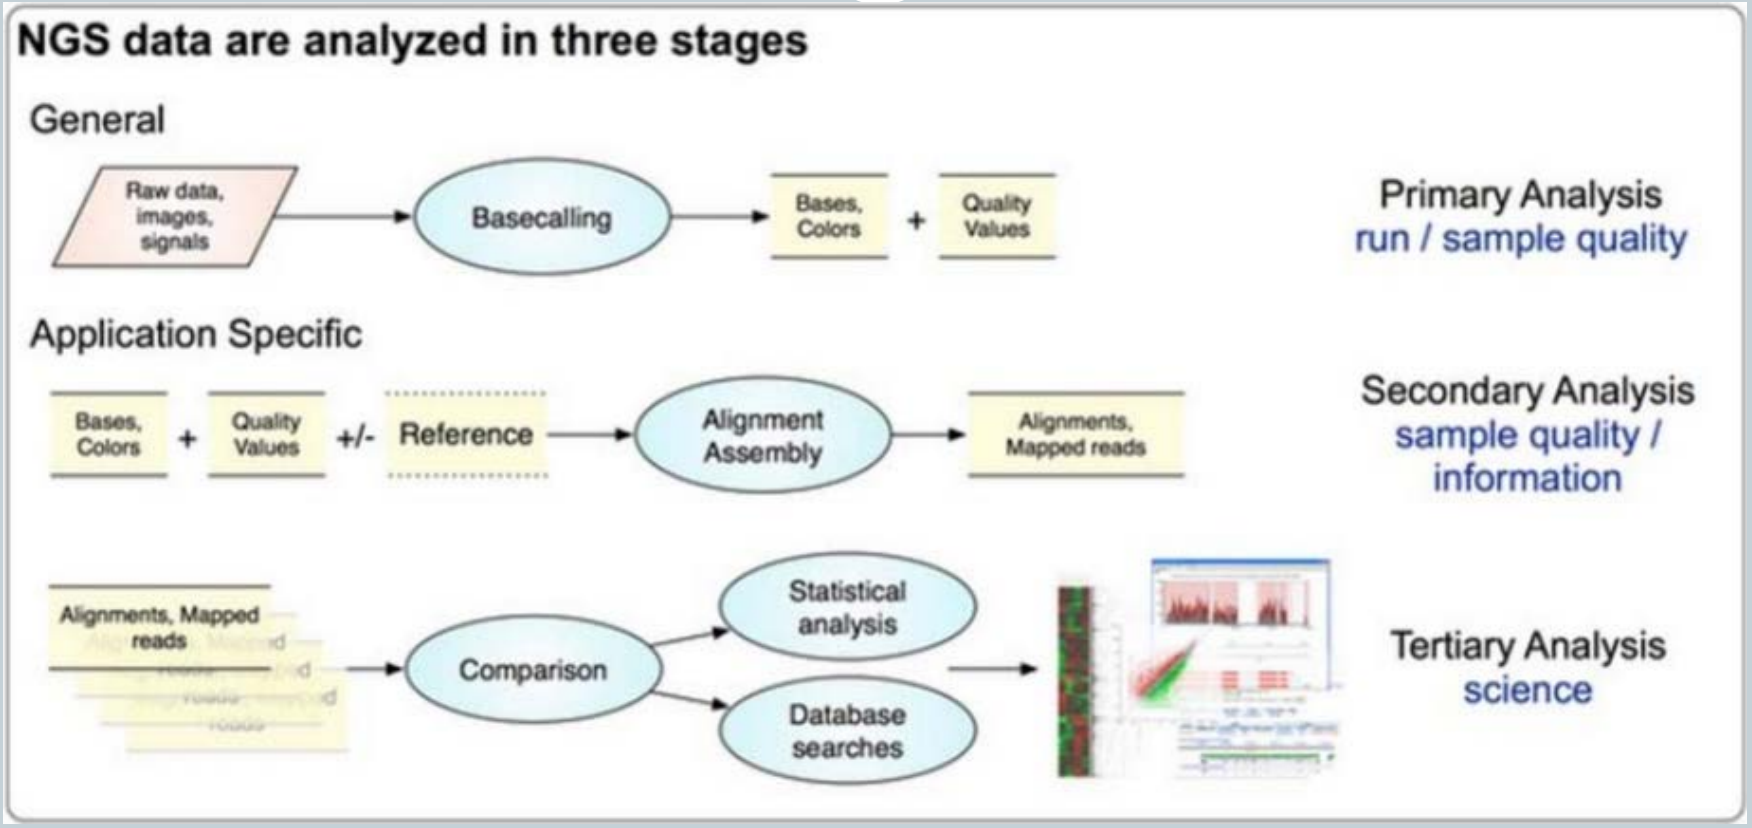
Depending on application (general applicable)
- 'de novo' assembly of genome (bacterial genomes,…)
- Mapping to a reference genome → mapped reads
- SAM/BAM/…

High-level analysis (specific for application)
- SNP calling
- Peak calling

NGS analysis workflow



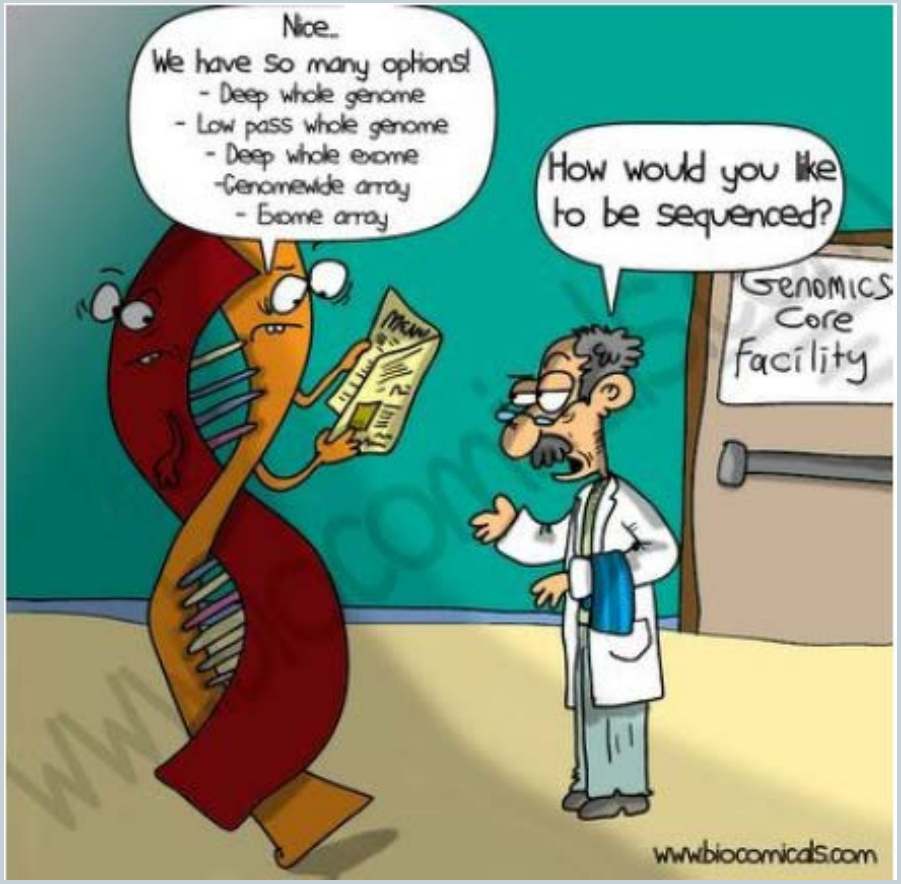
The three stages of NGS data analysis



- We will focus mostly on the first two...

NGS Applications are **sequencing** applications

- Whole Genome Sequencing
- Gene Regulation
- Epigenetic Changes
- Metagenomics
- Paleogenomics
- Transcriptome Analysis
- Resequencing
- ....



Why QC and preprocessing

- Sequencer output
  - Reads + **quality**
- Natural questions
  - Is the quality of my sequenced data ok?
  - If something is wrong, can I fix it?
- Problem: HUGE files

```
@HWI-EAS225:3:1:2:854#0/1
GGGGGGAAGTCGGCAAAATAGATCCGTAACTTCGGG
+HWI-EAS225:3:1:2:854#0/1
a`abbbbabaabbababb^``[aaa`_N]b^ab^``a
@HWI-EAS225:3:1:2:1595#0/1
GGGAAGATCTCAAAAACAGAAGTAAAACATCGAACG
+HWI-EAS225:3:1:2:1595#0/1
a`abbbababbbabbbbbbabb`aaababab\aa_`
```

Sequencing Data Formats

Raw sequence reads:

- Represent the sequence ~ **FASTA**

```
>SEQUENCE_IDENTIFIER
GATTTGGGGTTCAAAGCAGTATCGATCAAATAGTAAATCCATTTGTTCAACTCACAGTTT
```

- Extension: represent the quality, per base ~ **FASTQ** – Q for quality

```
@SEQUENCE_IDENTIFIER
GATTTGGGGTTCAAAGCAGTATCGATCAAATAGTAAATCCATTTGTTCAACTCACAGTTT
+
!''*((((***+))%%%++)(%%%%).1***-+*''))**55CCF>>>>>>CCCCCCC65
```

- OK, the strange signs at the last line indicate the quality at the corresponding base… But what's the decoding scheme? **(Nerd alert ahead !!)**
- We want to represent quality scores ~ Phred scores
- Q= -10 log P (with P being the chance of a base called in error)

Phred quality scores are logarithmically linked to error probabilities

Phred Quality Score	Probability of incorrect base call	Base call accuracy
20	1 in 100	99 %
30	1 in 1000	99.9 %
40	1 in 10000	99.99 %

Quality before content

```
@SEQUENCE_IDENTIFIER
GATTTGGGGTTCAAAGCAGTATCGATCAAATAGTAAATCCATTTGTTCAACTCACAGTTT
+
!''*((((***+))%%%++)(%%%%).1***-+*''))**55CCF>>>>>>CCCCCCC65

Example of the identifier line for Illumina data (non-multiplexed):

#@machine_id:lane:tile:x:y:multiplex:pair
@HWUSI-EAS100R:6:73:941:1973#0/1
```

- Phred + 33 → Sanger
- Illumina 1.3 + → Phred +64
- Illumina 1.5 + → Phred +64
- Illumina 1.8 + → Phred +33
- Solid → Sanger

Check your instument + version ➔ FastQC will give you a hint which scoring scheme is probably used

Extensions: FASTQ / FQ

What is quality?

Genome Res. 1998 Mar;8(3):175-85.

Base-calling of automated sequencer traces using phred. I. Accuracy assessment.

Ewing B[1], Hillier L, Wendl MC, Green P.

⊕ Author information

Abstract

The availability of massive amounts of DNA sequence information has begun to revolutionize the practice of biology. As a result, current large-scale sequencing output, while impressive, is not adequate to keep pace with growing demand and, in particular, is far short of what will be required to obtain the 3-billion-base human genome sequence by the target date of 2005. To reach this goal, improved automation will be essential, and it is particularly important that human involvement in sequence data processing be significantly reduced or eliminated. Progress in this respect will require both improved accuracy of the data processing software and reliable accuracy measures to reduce the need for human involvement in error correction and make human review more efficient. Here, we describe one step toward that goal: a base-calling program for automated sequencer traces, phred, with improved accuracy. phred appears to be the first base-calling program to achieve a lower error rate than the ABI software, averaging 40%-50% fewer errors in the data sets examined independent of position in read, machine running conditions, or sequencing chemistry.

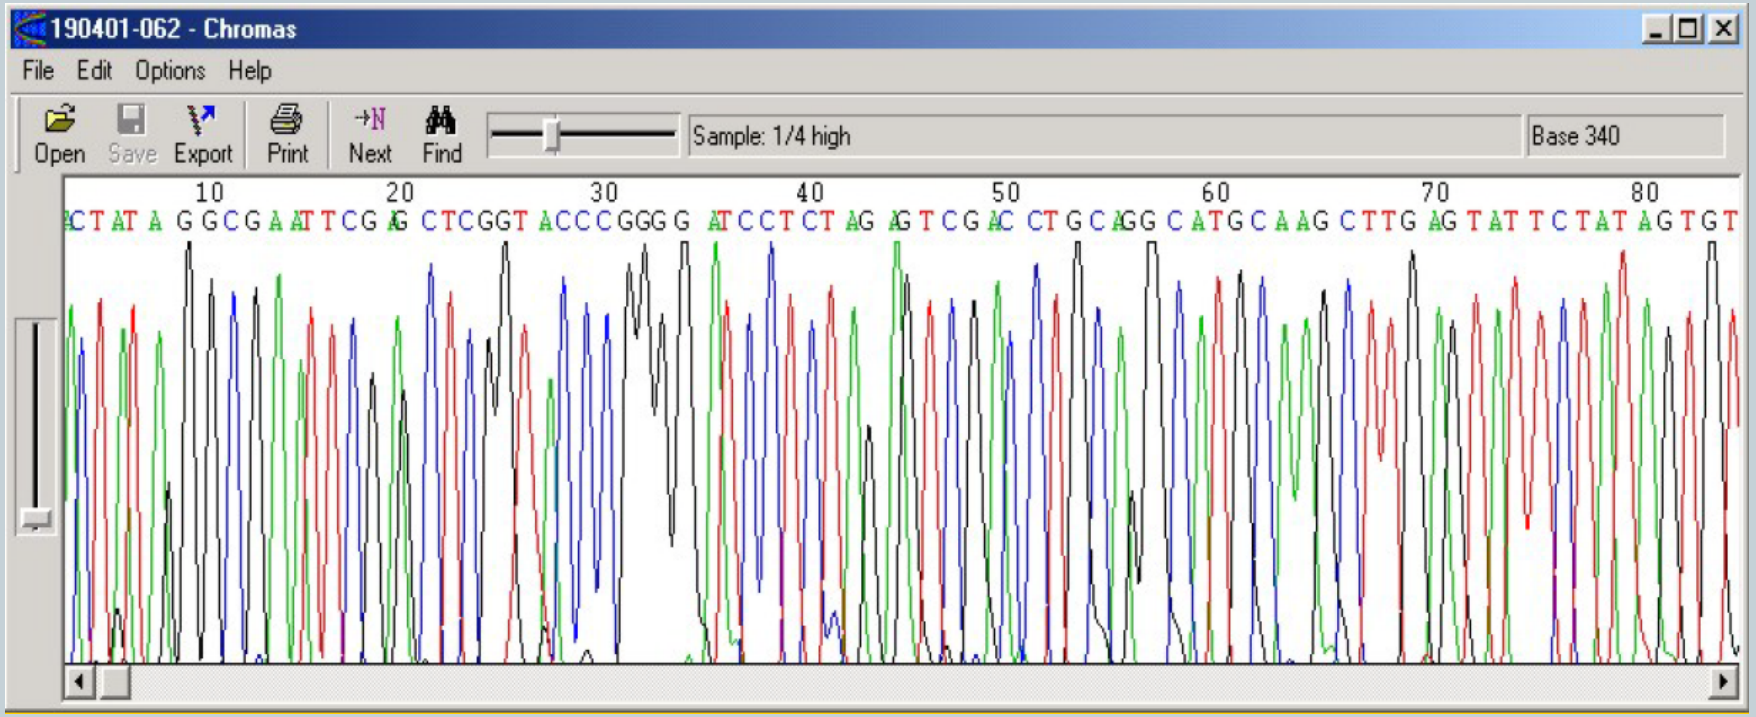
RESEARCH

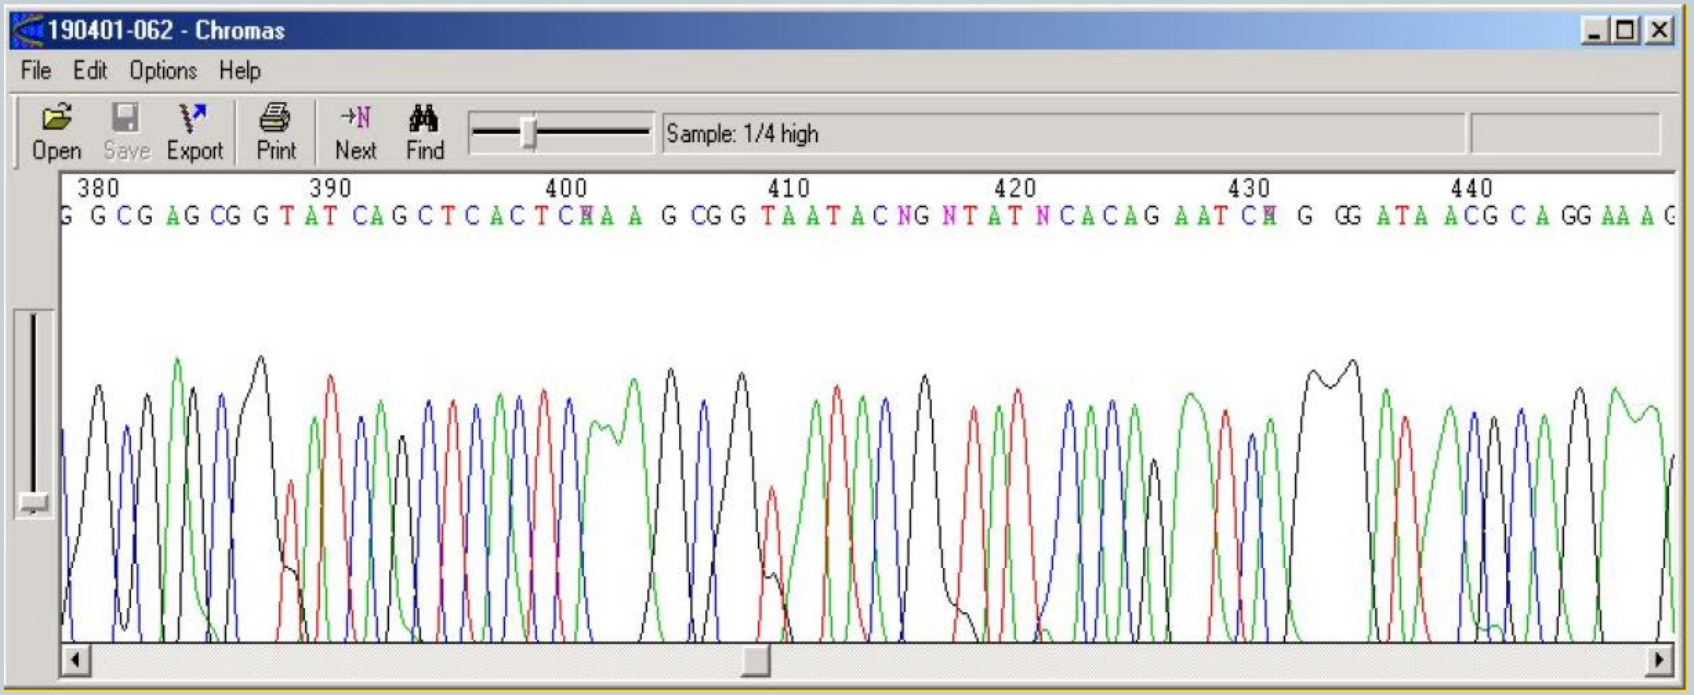
Base-Calling of Automated Sequencer Traces Using *Phred.* I. Accuracy Assessment

Brent Ewing,[1] LaDeana Hillier,[2] Michael C. Wendl,[2] and Phil Green[1,3]

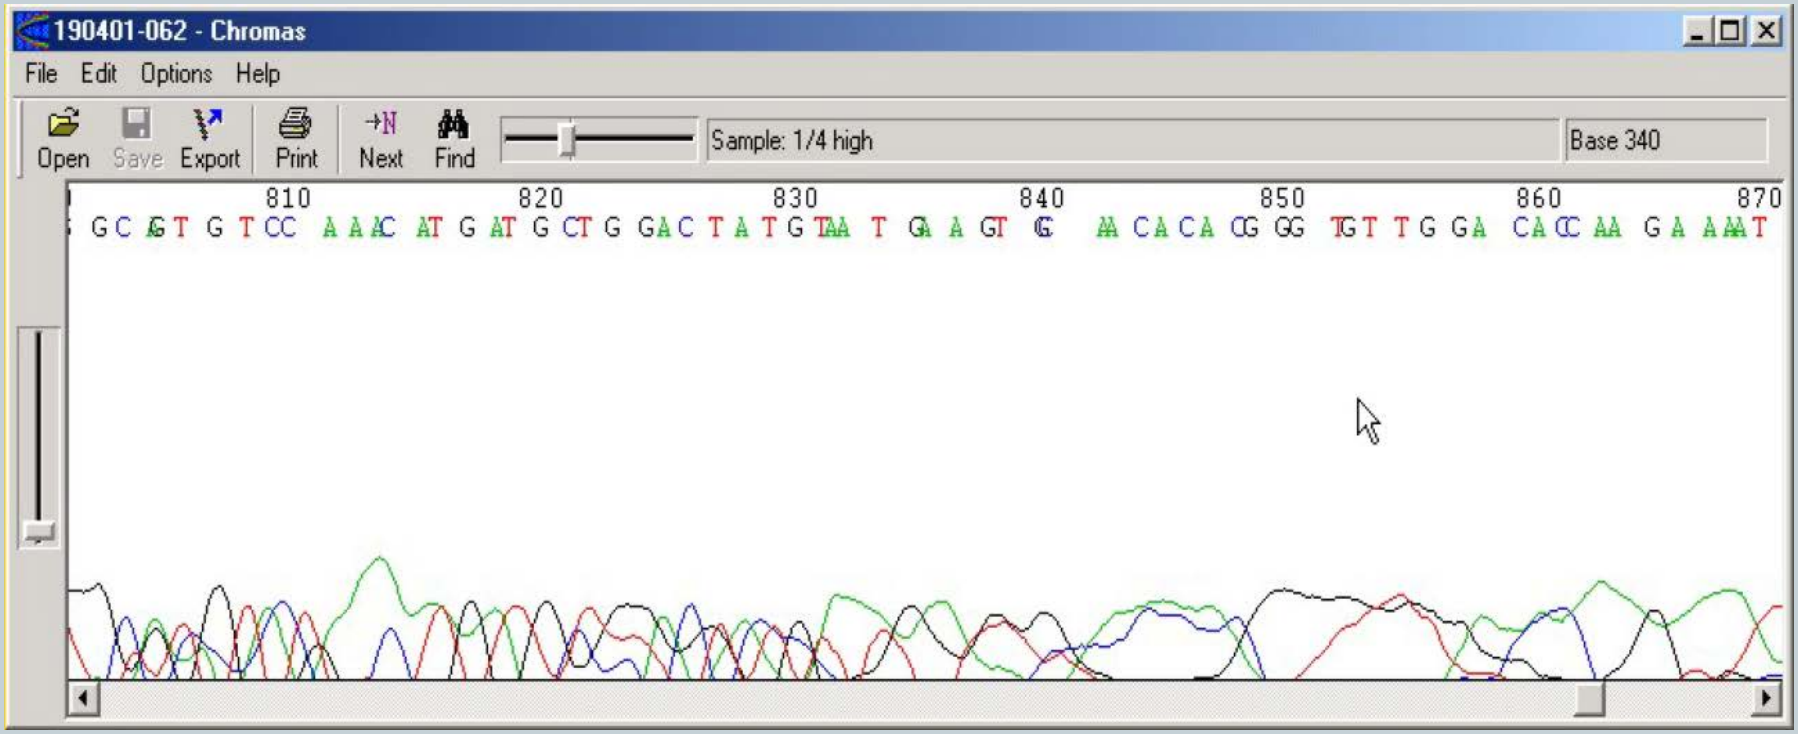
Trace File (high quality)



Trace File (Medium Quality)

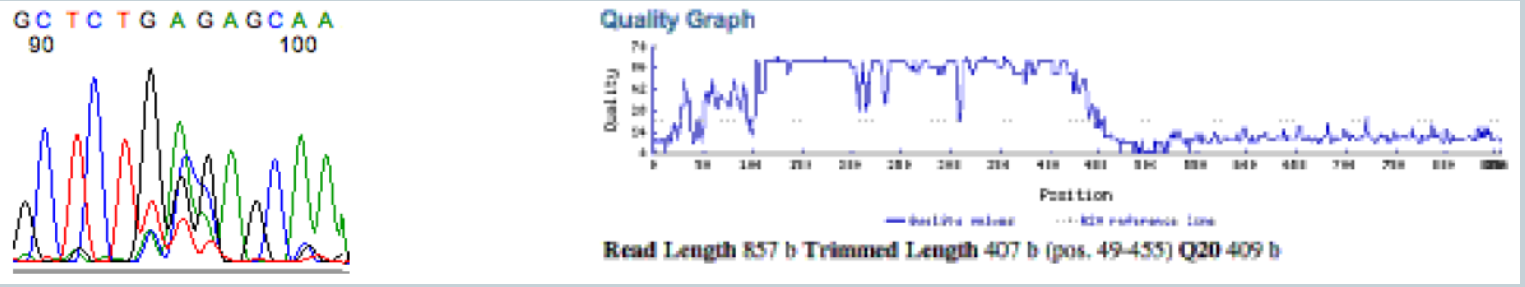


Trace File (Low Quality)



Phred Quality Scores

- Phred is a program that assigns a quality score to each base in a sequence. These scores can then be used to trim bad data from the reads, and to determine how good an overlap actually is
- Phred scores are logarithmically related to the probability of an error:
  - a score of 10 means 10% error probability,
  - 20 means a 1% chance,
  - 30 means a 0.1 chance, etc
- A score of 30 is usually considered the minimum acceptable score.



FASTQ File Format

- Each read is represented by four lines:

1. @ followed by read ID
2. Sequence
3. + optionally followed by repeated read ID
4. Quality line
   - Same length as sequence
   - Each character encodes the quality of the respective base

```

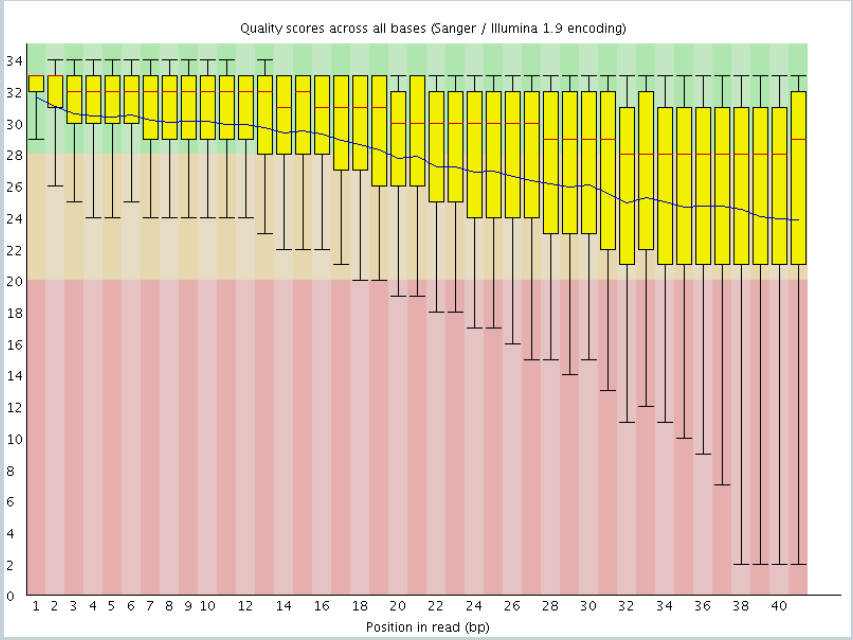
```

FASTQC

- As the name implies, FastQC is way to quickly see some summary statistics to check the quality of your NGS run.
  - It runs both as a GUI (requires Java) and as a command line program.
  - Provides several statistics:
    - Per Sequence Quality
    - Per sequence quality scores
    - Per base sequence and GC content
    - Per Sequence GC Content
    - etc..



Trimming

- Knowing quality → Act accordingly
- Adapter trimming
  - May increase mapping rates
  - Absolutely essential for small RNA
    Probably Improves de novo assemblies
- Quality trimming
  - May increase mapping rates
  - May also lead to loss of information
- Lots of software:
  - Cutadapt, Trim Galore!, PRINSEQ, etc.

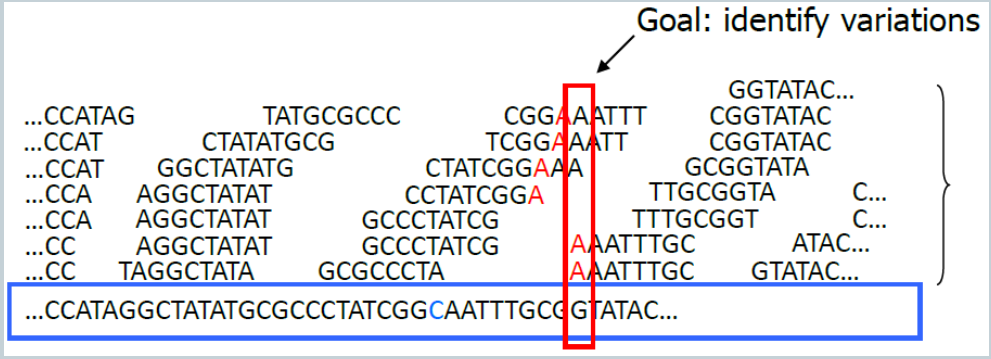
Mapped Reads

- Mapping: “align” these raw reads to a reference genome
  - Single-end or paired-end data?
  - How would you align a short read to the reference?

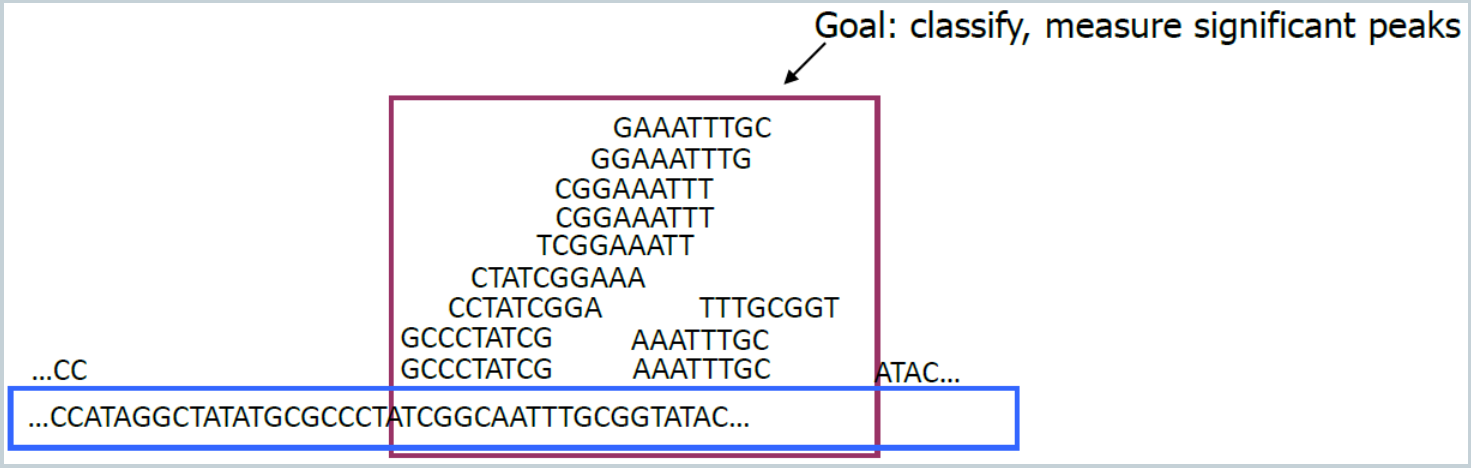
- Old-school: Smith-Waterman, BLAST, BLAT,...
- Now: mapping tools for short reads that use intelligent indexing and allow mismatches

Short read applications

- Genotyping

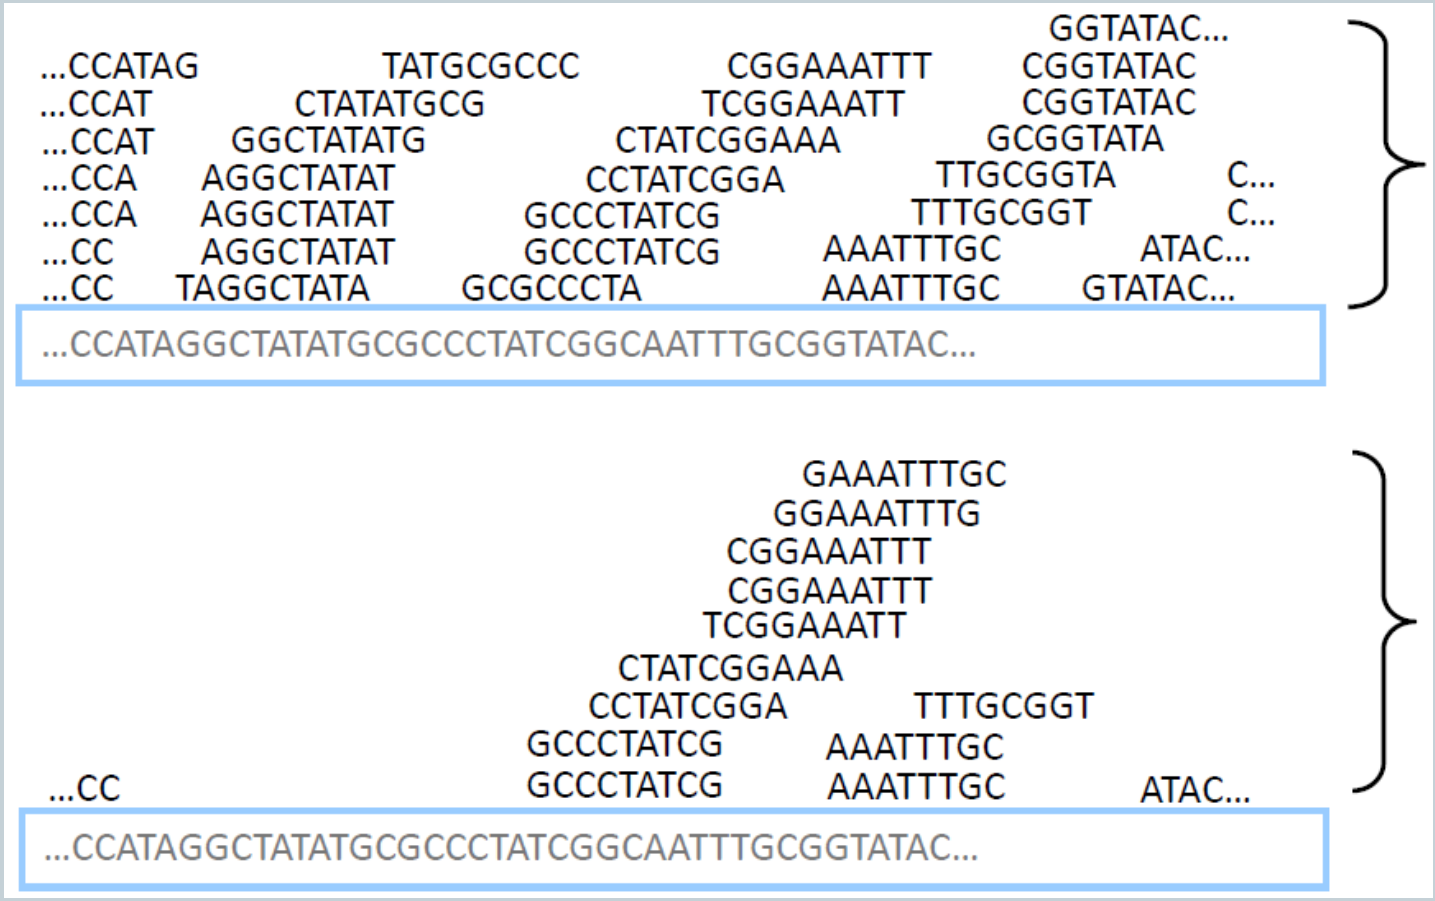


- RNA-Seq, ChIP-Seq, Methyl-Seq,...



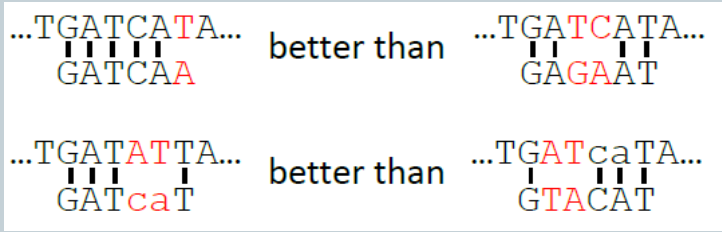
… always a problem

- Finding the alignment is a computational bottleneck



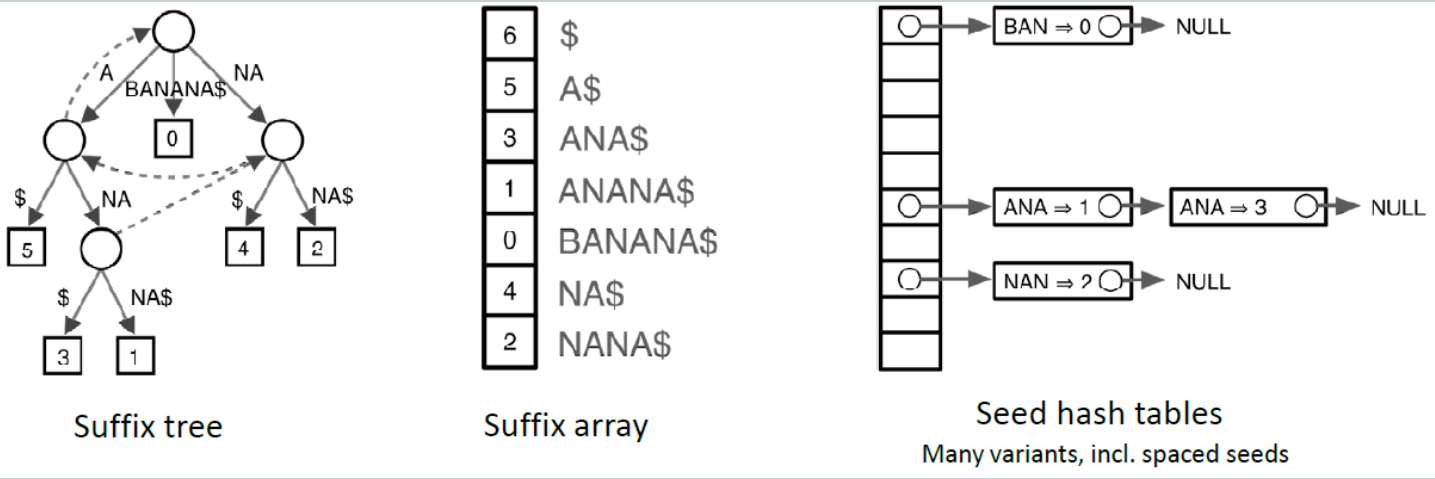
Defining the question

- Given a reference and a set of reads, report at least one “good” local alignment for each read, if one exists
  - Approximate answer to question: **where** in genome did read originate
- What is “good”? For now we concentrate on:
- Fewer mismatches = better
- Failing to align a low-quality base is better than failing to align a high-quality base



A few technical aspects (geeky stuff)

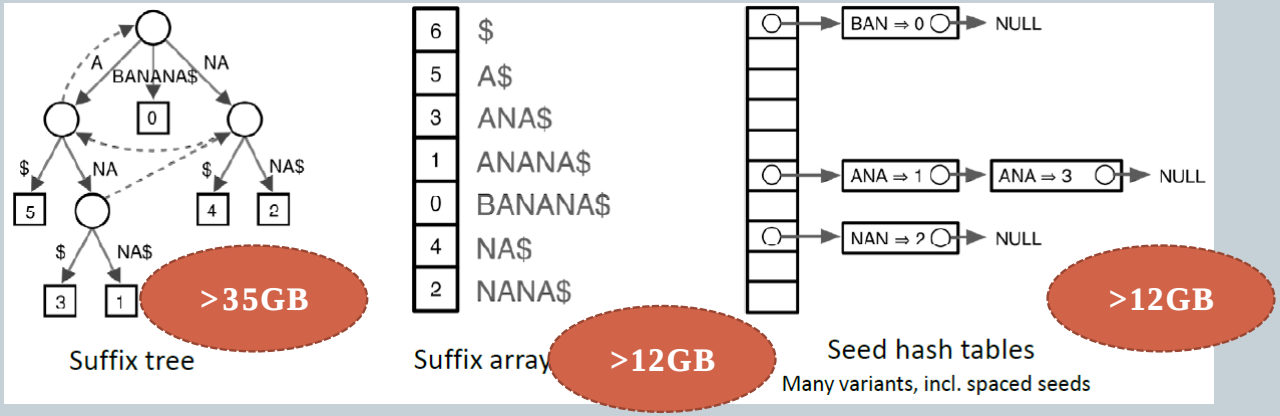
- Genomes and reads are too large for direct approaches like dynamic programming
- **Indexing/Hashing** is required



- Choice of index is key to performance

A few technical aspects (geeky stuff)

- Genome indices can be big. For human:

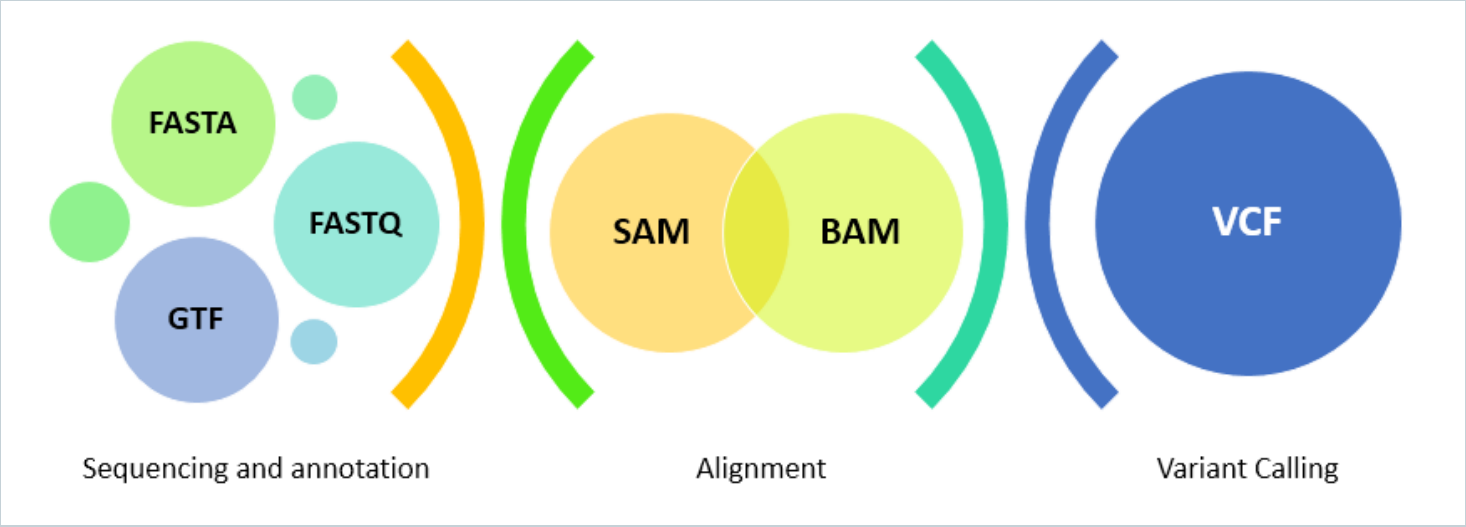


- Large indices necessitate painful compromises

1. Require big-memory machines
2. Use secondary storage
3. Build new index each run
4. Subindex and do multiple passses

Interlude

(not only) NGS File Formats



The **S**equence **A**lignment/**M**ap Format

- Generic alignment format
- Supports short and long reads
- Supports different sequencing platforms
- Flexible in style, compact in size, computationally efficient to access

- SAM File Format
  - BAM is the binary version of the SAM file; not human readable but indexed for fast access for other tools / visualization / …

SAM Fields

```
DESCRIPTION OF THE 11 FIELDS IN THE ALIGNMENT SECTION

# QNAME: template name
#FLAG
#RNAME: reference name
# POS: mapping position
#MAPQ: mapping quality
#CIGAR: CIGAR string
#RNEXT: reference name of the mate/next fragment
#PNEXT: position of the mate/next fragment
#TLEN: observed template length
#SEQ: fragment sequence
#QUAL: ASCII of Phred-scale base quality+33

Other useful formats in NGS

- **G**eneral **F**eature **F**ormat
  - used for annotation of genetic / genomic features, such as all coding genes in Ensembl
  - often used in downstream analysis to assign annotation to regions/peaks/….

```
FIELDS USED:

# seqname (the name of the sequence)
# source (the program that generated this feature)
# feature (the name of this type of feature - for example: exon)
# start (the starting position of the feature in the sequence)
#  end (the ending position of the feature)
# score (a score between 0 and 1000)
# strand (valid entries include '+', '-', or '.')
# frame (if the feature is a coding exon, frame should be a number between
0-2 that represents the reading frame of the first base. If the feature is
not a coding exon, the value should be '.'.)
# group (all lines with the same group are linked together into a single
item)

track name=regulatory description="TeleGene(tm) Regulatory Regions"
#chr   source   feature   start    end   scores tr fr group
chr22  TeleGene enhancer  1000000  1001000  500 +  .  touch1

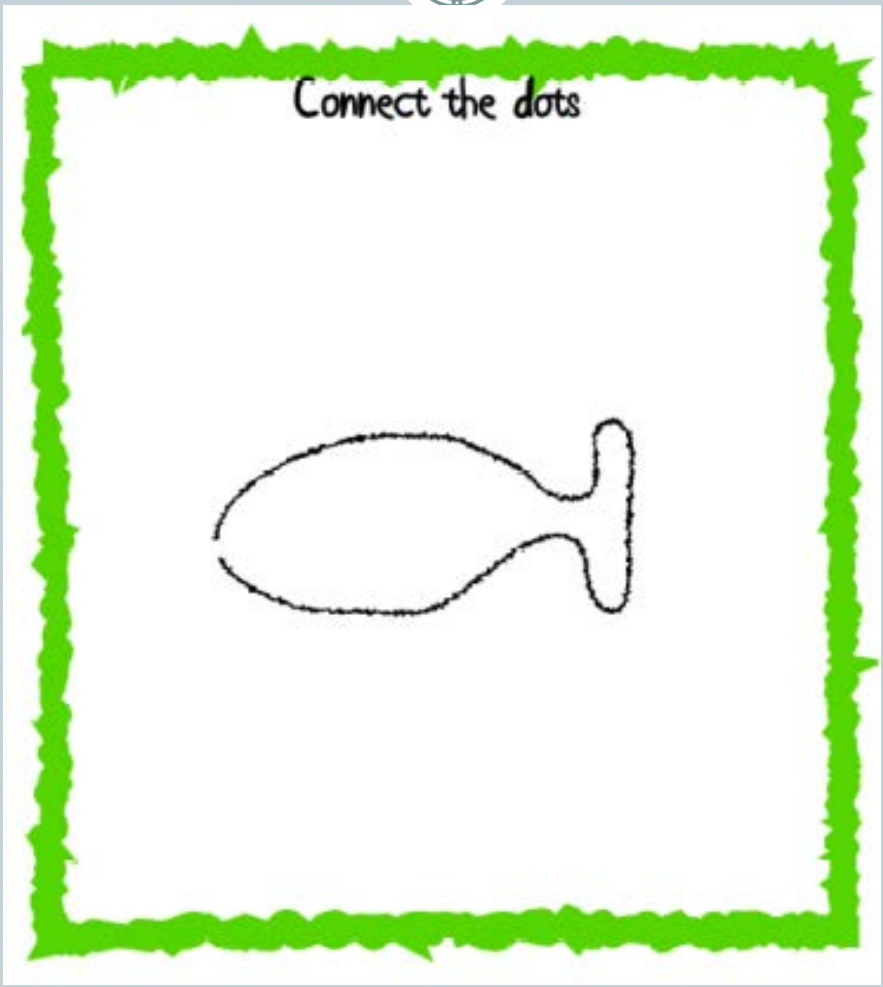
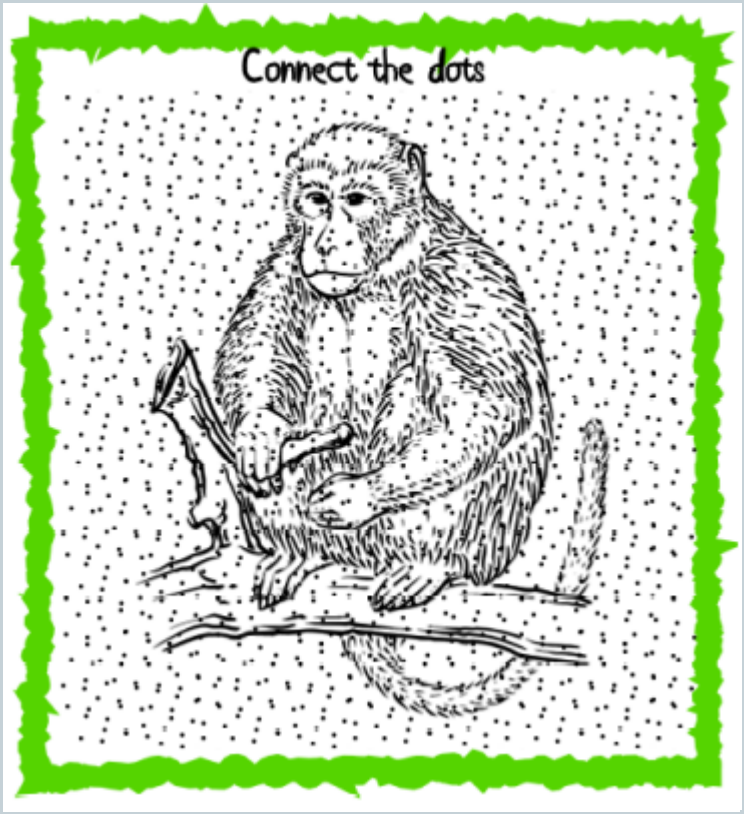
aaaand back to the story

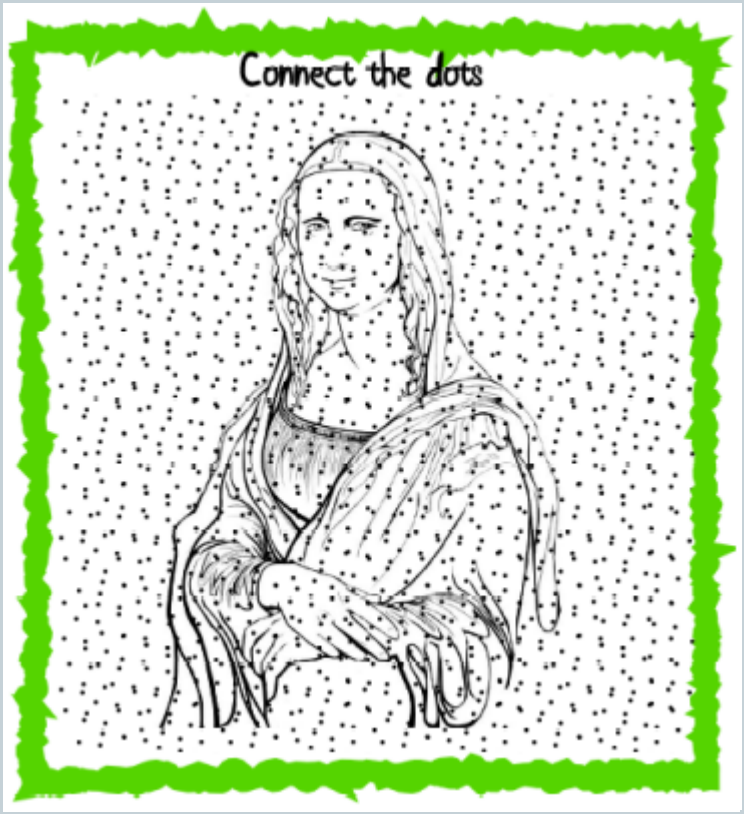
Assembly simplified



Assembly simplified

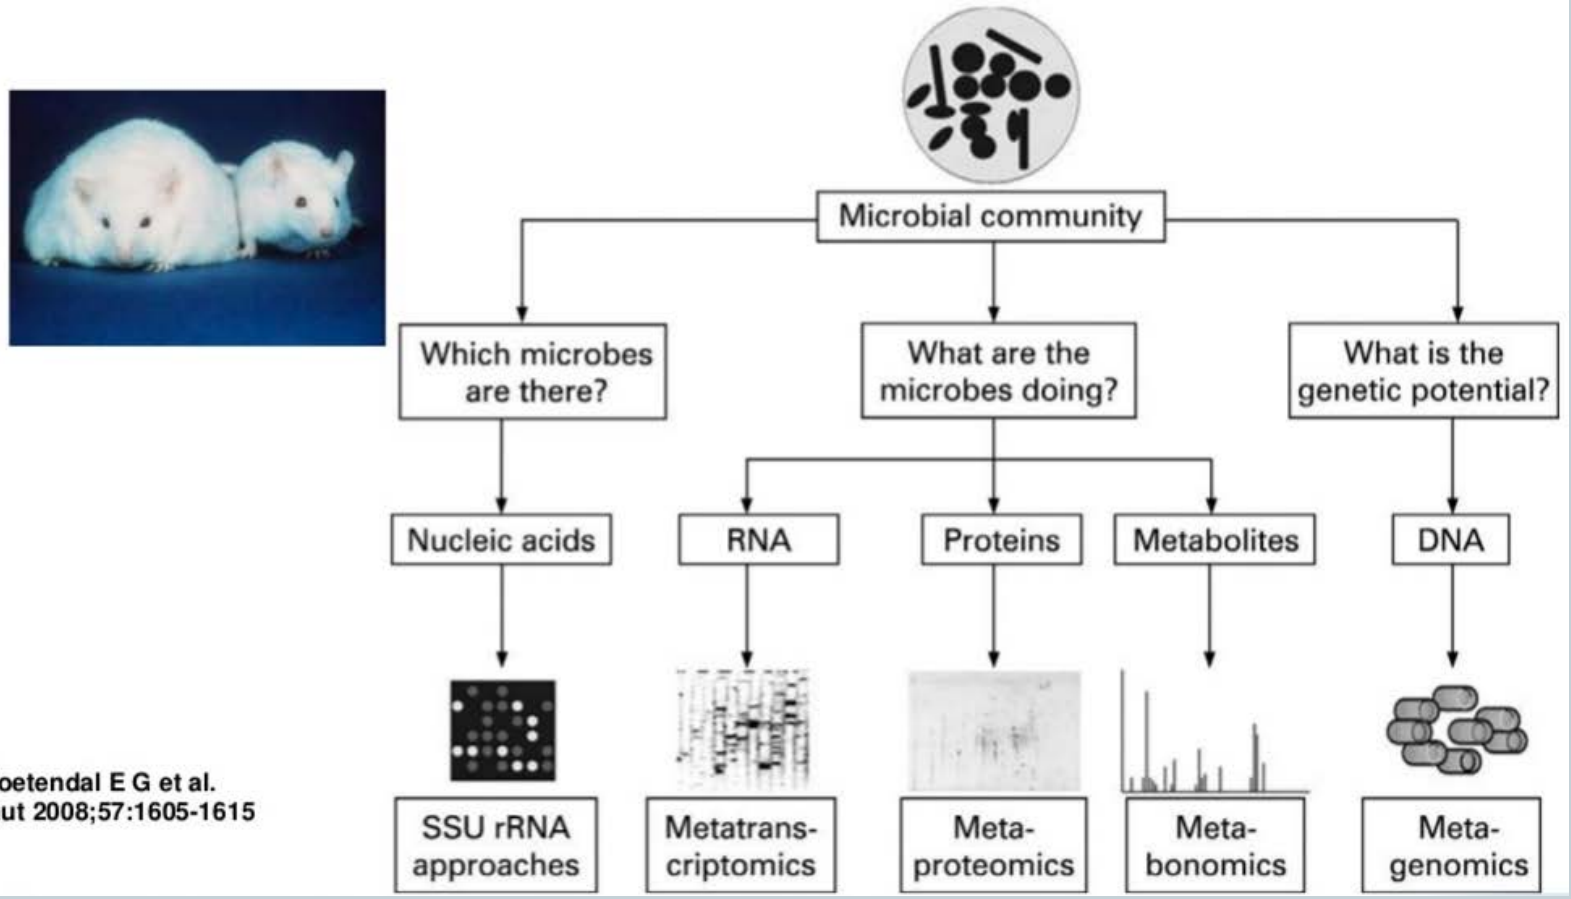
- Impossible to assemble manually





Metagenomics

- (and other community based “omics”)



De-novo sequencing

Genome and Transcriptome assembly of novel organism

Genotypic
genomics simplified

BowTie

- BowTie is the most commonly used aligner
- Employs an indexing algorithm that can trade flexibility between memory usage and running time
- For Human data (NCBI 36.3) on an 2.4 GHz AMD Opteron:

Physical memory Target	Actual peak memory footprint	Wall clock time
16 GB	14.4 GB	4h:36m
8 GB	5.84 GB	5h:05m
4 GB	3.39 GB	7h:40m
2 GB	1.39 GB	21h:30m

TopHat

- TopHat is one of many applications for aligning short sequence reads to a reference genome.
- It uses the BOWTIE aligner internally.
- Genome alignments from TopHat were saved as BAM files, the binary version of SAM (samtools.sourceforge.net/).
- Other alternatives are BWA, MAQ, OLego, Stampy, Novoalign, etc

We've aligned the data. Then what?

- Depending on the target study.

Gene	Treatment 1			Treatment 2		
1	14	18	10	47	13	24
2	10	3	15	1	11	5
3	1	0	10	80	21	34
4	0	0	0	0	2	0
5	4	3	3	5	33	29
.	.	.	.	.	.	.
.	.	.	.	.	.	.
.	.	.	.	.	.	.
53256	47	29	11	71	278	339
Total	22910173	30701031	18897029	20546299	28491272	27082148

Differential Expression

- To determine if gene 1 is DE, we would like to know whether the proportion of reads aligning to gene 1 tends to be different for experimental units that received treatment 1 than for experimental units that received treatment 2

14 out of 22910173		47 out of 20546299
18 out of 30701031	vs.	13 out of 28491272
10 out of 18897029		24 out of 27082148

Cufflinks

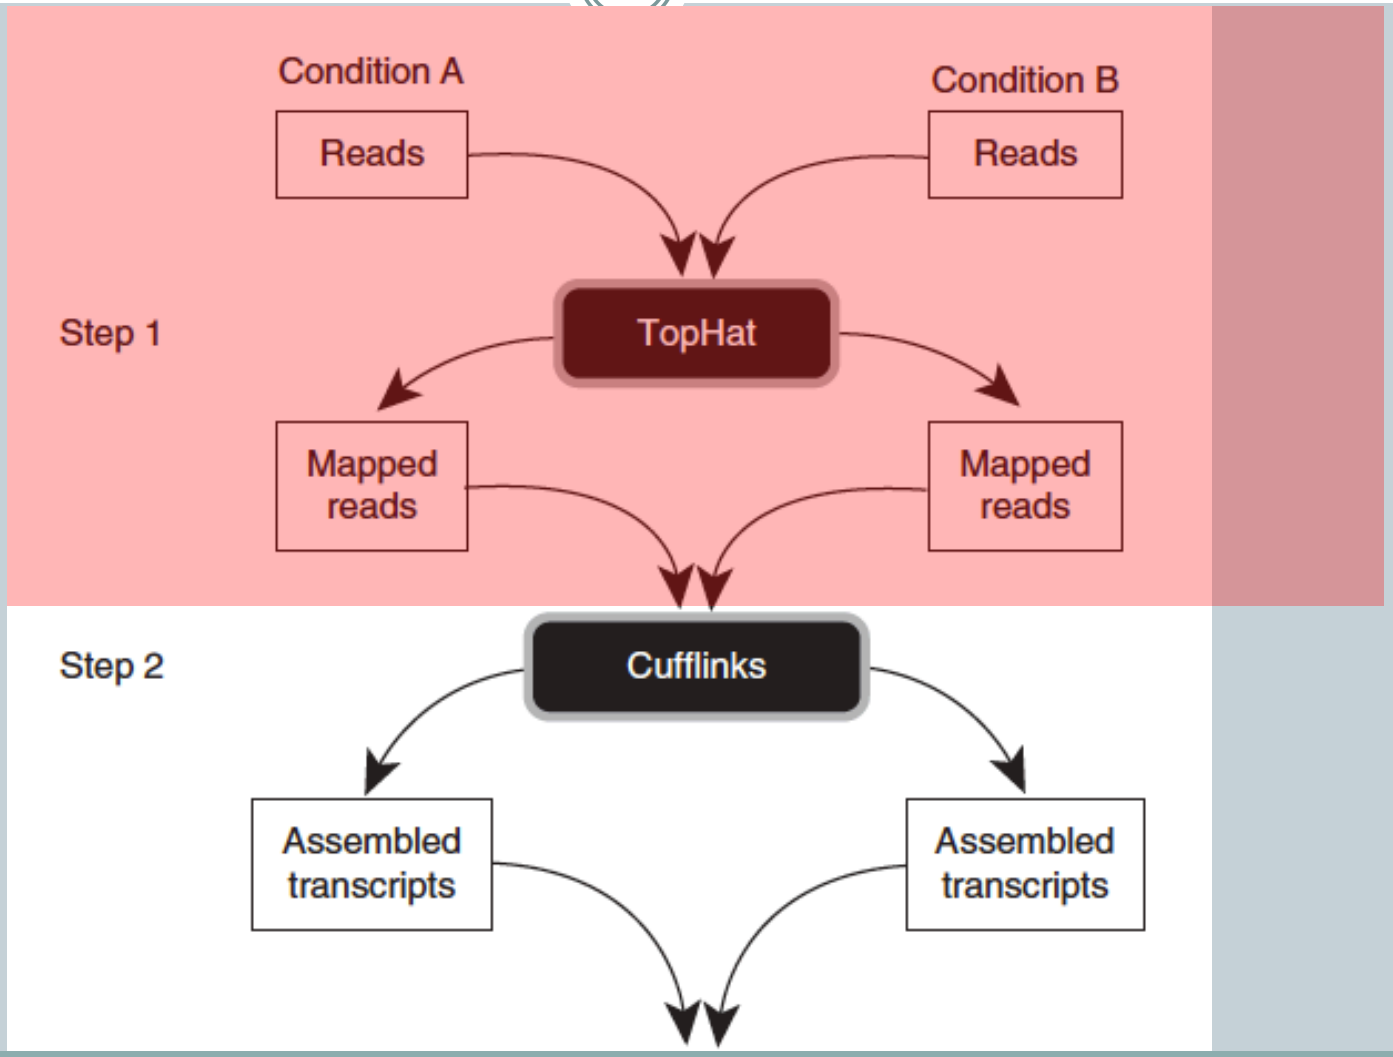
- CuffLinks is a program that assembles aligned RNA-Seq reads into transcripts, estimates their abundances, and tests for differential expression and regulation transcriptome-wide.

- CuffDiff is a program within CuffLinks that compares transcript abundance between samples

Putting it all together

- There are several protocols, tools and (now) platforms that are specific to NGS data analysis:
  - Tuxedo protocol
  - Galaxy platform
  - Chipster platform

Tuxedo



Condition A
Condition B
Reads
Reads
Step 1

Assembled transcripts

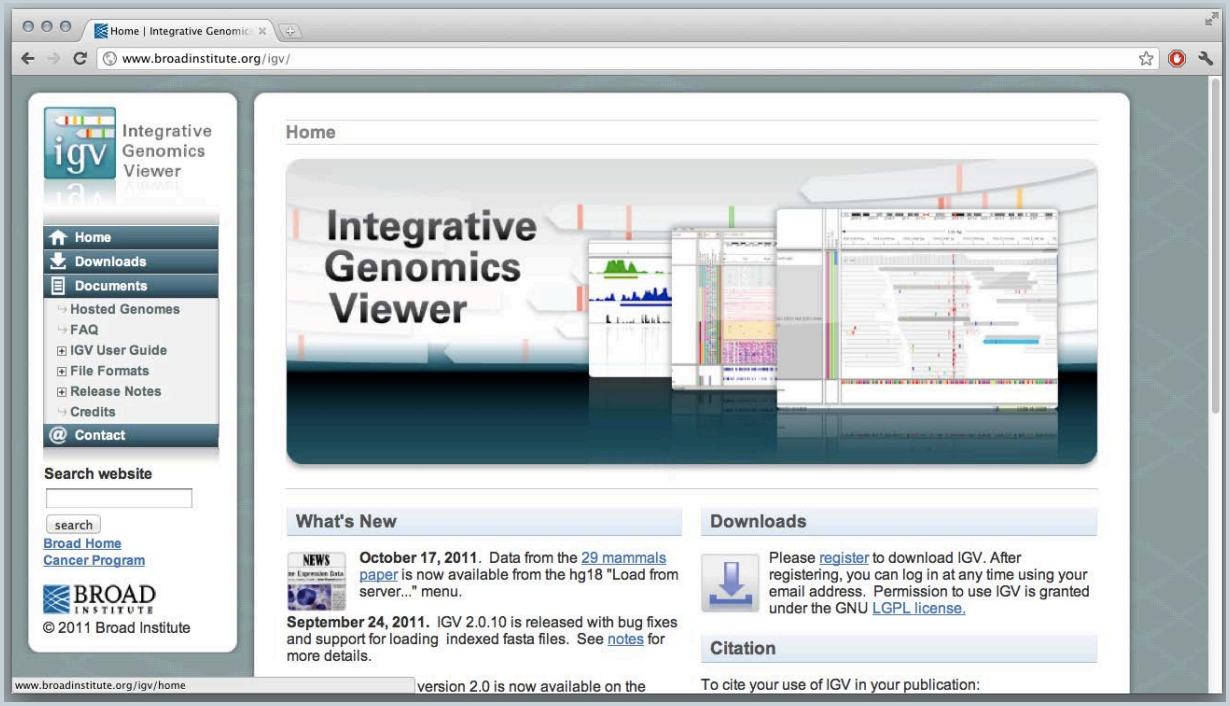
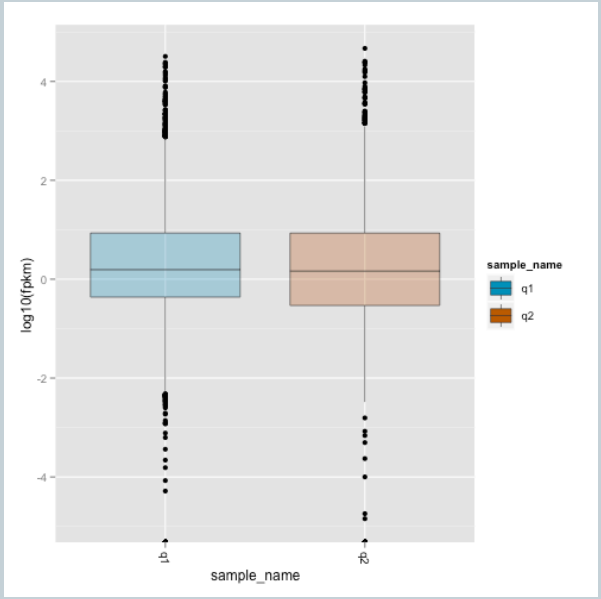
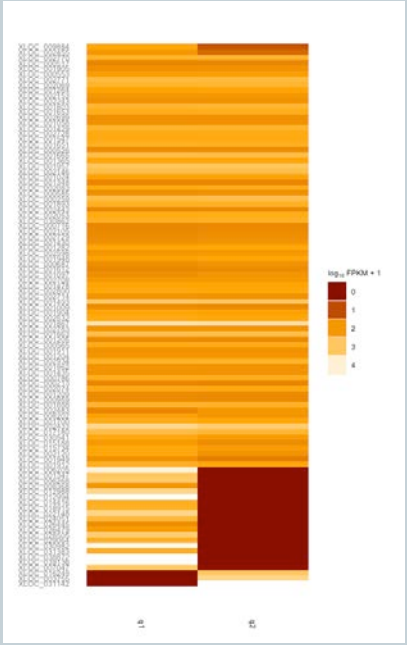
In closing: Visualization is key

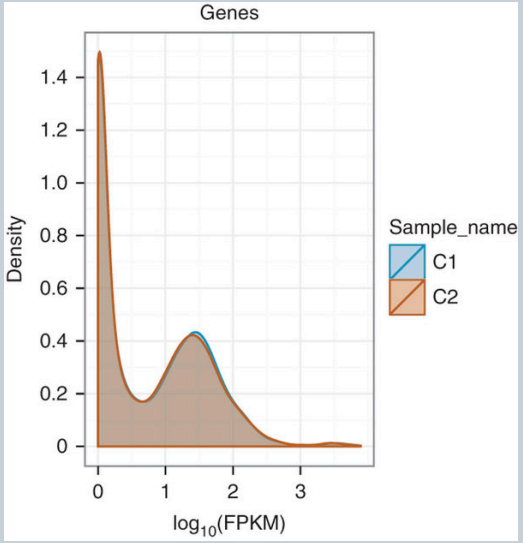
- The Integrative Genomics Viewer (IGV) is a high-performance visualization tool for interactive exploration of large, integrated genomic datasets.
  - It supports a wide variety of data types, including array-based and next-generation sequence data, and genomic annotations.



- Downstream Analysis







Thank you for your patience!
